Social media recruiting and Online Personal Reputation evaluation by

Recruiters in Israel / Yohanan S. Ouaknine

**Abstract** 

Online Reputation (OR) is the public evaluation of an individual, based on his behavior and

the information published online by himself or shared by others. The elements of a person's

online reputation may include pictures and movies, online résumé and posts or comments in

blogs. Online Reputation is an important element when recruiters gather relevant and credible

personal information in order to evaluate and screen candidates. Evaluation and screening

with Online Reputation is widely used by recruiters in USA and Europe (Haefner, 2009;

Cross-Tab, 2010; Madden & Smith, 2010). However, such a study was never performed in

Israel.

This research examines the attitudes of recruiters and HR professionals concerning online

reputation information in their candidate evaluation processes by asking the following

questions: Do Israeli recruiters use online reputation in the recruitment process? To what

extent online reputation components are perceived as relevant, credible and affecting the

decision to screen candidates? What are the goals and online resources used by recruiters in

Online Reputation search? Are recruiters willing to pay for such and information? Do

organizations use Online Reputation in their formal procedure of recruitment?

An innovative approach was required to recruit randomly selected Israeli recruiters thru

connections within the LinkedIn Network. This method resulted in a 31.3% (N=104)

participation rate (valid answers only). The participants (age: 25 to 58, 87 women) filled an

online questionnaire, mainly about the impact of online reputation on candidate screening, the

relevance and the credibility of online reputation information, free and paid sources used in

their tasks and their goals in social media recruiting.

Highlights of the study's findings show that 85% of the Israeli recruiters use Online

Reputation Search in the recruitment process. Means of relevancy and credibility of

professional values and norms (like writing about a previous employer or being a member of

professional community) were high (M=3.9, SD-0.9) on a Lickert scale of 1-5, compared to

pictures and hobbies which were unexpectedly low (M=2.6, SD=1.0). While a positive

correlation was found between credibility and relevancy (r=0.32, p < .001, n=97), no

significant correlation was found between these variables and the impact on the decision to

screen candidates. Other findings show that recruiters use principally free resources like

Google (79%) and LinkedIn (96%) for online reputation search and are only 9% are willing

to pay for information about candidates (N=8). This study also indicates that only a small

number of Israeli companies have made online reputation screening a formal requirement of

their hiring process (13%).

The conclusions of this research show that Israeli recruiters, like their colleagues in other

countries, use Online Reputation to fill the gap of information in the recruitment process.

Another conclusion is that Online Reputation has a major impact on the screening process but

integration of this activity in a formal hiring process is still low when compared to other

countries. The fact that recruiters are not willing to pay for information could be explained by

the works of Shapiro & Varian (1999) where the perceived value of information is decided

after use and not before. The findings about the absence of correlation between relevancy,

credibility and impact could be explained by the works of Feldman & March (1981)

"Information in Organizations as Signal and Symbol". Their study suggest that organizations

gather more information than they need as they work in a surveillance mode rather than a

decision mode, where information is only needed to reduce uncertainties and not necessarily

to decide. Another track could be cultural differences between Israeli and American or

European recruiters about information gathered concerning a candidate.

A major limitation to this work is the exclusive use of the LinkedIn Network for participant's

recruitment as one could reasonably assume that not all the Israeli recruiters are members of

tradition of the contraction of

אוניברסיטת בר-אילן (עייר) הפקולטה למדעי הרוח הספריה ללימודי מידע

this network. A second limitation is the descriptive quantitative methodology used to study

this phenomenon.

This research contributes to the study of recruitment and Online Reputation fields by focusing

on the Israeli recruiter point of view while most studies examines the phenomenon from a

candidate's perspective. This research may also contribute to enrich recruiter training in

candidate's screening and eventually, awareness of job seekers about personal information

published online
